Notes & Definitions:

- 1 Contact resistance measured at currents $\geq 100A$.
- 2 Insulation resistance is 50 Mohms after life.
- 3 Coil ratings are listed for continuous duty operation. External PWM economization can be used following instructions in Applications Note [AN-019](#). Contactor is operated by a coil that changes resistance with temperature. See Applications Notes [AN-020](#) and [AN-030](#) for coil versus temperature graphs.
- 4 Minimum current is 0.1mA, 5V. The auxiliary contact is mechanically linked to the main power contacts.
- 5 Continuous currents assume a 65°C rise on the power terminals. Customer must limit terminal temperature to 150°C continuous.

APPLICATION NOTES

- Contactors feature internal transorb for coil suppression. For continuous duty coil operation, no external diodes should be added across the coil. The use of additional external coil suppression can slow the release time and invalidate the life cycle ratings, or can cause the contactor not to be able to interrupt the maximum current specified. If lower coil back EMF is required, please contact GIGAVAC for assistance.
- Applications with capacitors will require a pre-charge circuit. [Click here](#) for more information.
- Electrical life rating is based on resistive load with 27μH maximum inductance in circuit. Because your application may be different, we suggest you test the contactor in your circuit to verify life is as required.
- End of life is defined as when the dielectric, insulation resistance or contact resistance exceeds the specifications listed.
- Main power contacts (A1, A2) are not polarity sensitive.
